Introduction

The HIDTA County-Level Overdose Mortality Report provides an annual overview of overdose mortality across the 33 High Intensity Drug Trafficking Areas (HIDTAs) in the United States. Each report focuses on the counties within a HIDTA's Area of Responsibility (AOR) and includes key indicators such as the overdose death rate per 100,000 population, U.S. rank, state rank, local AOR rank, and rate classification.

The data used in this report were sourced from CDC WONDER¹ and analyzed by the Drug Threat Analysis Group (DTAG). This analysis is designed to help the HIDTAs identify local overdose trends and understand how their AOR compares to national, state, and regional levels. DTAG will follow up with additional state-level overdose reports that explore broader trends and provide visual representations of the data.

To improve usability, this report is presented in a hyperlinked PDF format, allowing for quick navigation to specific sections and county-level data.

J. David Hamby,
Drug Threat Analysis Group (DTAG)
National Coordinator

Methodology

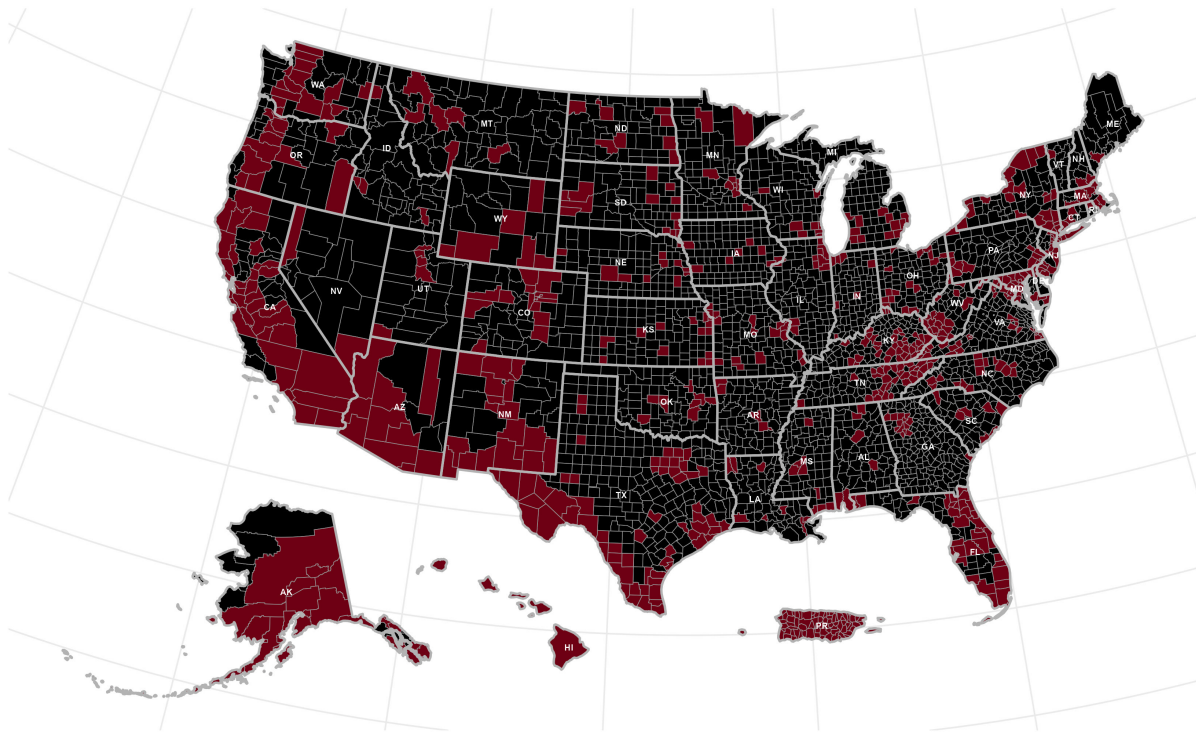

This analysis aggregates overdose death data for the five-year period from 2020 through 2024, focusing specifically on counties designated within High Intensity Drug Trafficking Areas. It should be noted that the final year of reporting data (2024) remains provisional and may be subject to revision as additional death certificates are processed and finalized by state vital statistics offices.

To calculate standardized overdose rates that allow for meaningful comparisons across communities of varying sizes, the average annual number of overdose deaths for each county was divided by the average population of that county over the five-year study period. This approach provides an estimated annual overdose rate per 100,000 for each community. All calculations and data processing for this project were prepared in the statistical package R² and RStudio³. The pdf document was rendered in Quarto, an open-source technical publishing system that converts plain text documents into multiple output formats including pdf⁴.

In accordance with standard public health data privacy protocols, overdose numbers for communities that experienced small numbers of deaths during the study period have been suppressed and are not displayed in this report. This suppression prevents potential identification of individuals in smaller communities while maintaining the statistical integrity of the analysis.

Each county is ranked from highest to lowest overdose rate to facilitate comparison with HIDTA, state, and national benchmarks. This ranking system enables stakeholders to quickly identify their community's relative position within their HIDTA AOR, state, and in the broader national context. Counties are further classified into three categories based on their deviation from the national mean overdose rate: High, Moderate, or Low. This classification system provides an additional analytic framework for understanding the relative severity of overdose impacts across different communities and can be used to inform resource allocations and intervention prioritization decisions. Counties with a deemed "High Overdose Death Rate" are highlighted in Red.

HIDTA Designated Counties as of 2024

The Office of National Drug Control Policy has designated thirty-three regions across the United States as High Intensity Drug Trafficking Areas (HIDTAs). Collectively, these regions include nearly twenty-three percent of all U.S. counties, and account for roughly seventy percent of the United States population.
